CRU-DATAPORT™ TO SHOWCASE COMPUTER DATA SECURITY SOLUTIONS AT GOVSEC

Booth #336 To Feature New DataPort For Secure ID Cards, DES, SATA and Other Portable Hard Drive Technologies

VANCOUVER, Wash. (July 21, 2003) – Government agencies are under more pressure than ever before to ensure the security of their IT systems from external threats including terrorists, criminals and hackers. One of the most reliable ways to protect computer data is to remove and secure the hard drive itself, which numerous government agencies do with CRU-DataPort™ removable hard drive storage devices. CRU will showcase several of its new data security solutions in booth number 336 at this year's GOVSEC Expo.

A leading supplier of computer data security and storage solutions for more than 16 years, CRU will preview its new **DataPort for secure ID cards, DataPort prototypes with built-in data encryption** for added security, **ruggedized 2.5" DataPort**, and **Serial ATA DataPort V plus**, the industry's first removable data storage module supporting the Serial ATA interface.

DataPorts are currently in use on Classified Networks and Secure Workstations worldwide. DataPorts are also used by several Department of Defense agencies to secure, backup and transport classified data between individuals and work groups. DataPorts enable Emergency Operations Center readiness, are ideal for training labs and classrooms, and enable network administrators to perform software maintenance and upgrades with virtually no downtime.
